

**APP Timber*MarinePine*** is 2.5 # heavy retention CCA treated. We offer a broad range of timber piling, as well as, many dimensions of lumber and timbers. This material can be used as support piling for docks/marinas, bulkheads, and piers, turning dolphins, timber cribbing and many other marine related applications.

When exposed to the often severe buffeting of both wind and waves, the flexibility of wood can yield superior resistance as compared to rigid construction materials. In addition, wood can't rust, won't corrode, and doesn't spall.

In the event structural damage does occur, wood can usually be repaired in a more efficient and less costly way than other construction materials. And repairs can be made in all kinds of weather, in both wet and dry environments, often using nothing more complicated than ordinary carpentry tools.

Furthermore, wood is a renewable resource with several environmental advantages.

Without adequate preservative protection, wood is subject to destruction from marine organisms such as Toredos (a shipworm that bores elaborate tunnels within wood) and Limnoria (gribbles that attack the exterior surface in a band around piling). Chromated Copper Arsenate (CCA) preservative can prevent these organisms from destroying wood.

### **Advantages of APP Timber*MarinePine***

- Protection against rot, fungal decay, and termites
- 70 year successful track record
- Easy to work with, repair, and modify with common tools
- Strong, resilient, versatile, and economical
